

Secondary Guarding **Anti-Entrapment Devices**

Along with the electrical safety devices we offer, we also have multiple physical safety devices that can be fitted to your machine to further aid the safety of operators and those around.

Protective Steel Structure

These steel structures physically protect the operator and help to reduce the possibility of being held against the controls in the event of unintended contact with an obstruction.

- Easily installed by bolting directly to the platform without need for any modifications.
- Low weight (21kg) minimizes platform capacity reductions.
- Available upon request on all boom lift platforms.

Protective Control Guard

The control guard allows the machine's controls to be protected from accidental operation whilst still retaining clear visibility.

- Robust control box shroud provides additional guarding of controls; reducing the risk of unintended actuation.
- A secondary anti-tamper 'enable' button located on the side of the control box.
- Robust design.
- Available upon request on all scissor lift platforms.

Protective Screen

Adding a protective screen to the MEWP basket is an effective way of preventing injury and reducing the risk of tools falling from the platform.

- Lightweight Mesh
- Full basket coverage
- Retains maximum visibility whilst still providing protection from dropped objects.
